Technical data sheet

SUSTAMID® 46

Product characteristics

- High continuous service temperature
- Excellent sliding properties
- High heat deflection temperature

Typical fields of application

- Mechanical engineering
- Electrical industry
- Vehicle construction

Thermal conductivity DIN 52612-1 W / (m * K) 0,30	
Thermal capacity DIN 52612 kJ / (kg * K) -	
Coefficient of linear thermal expansion DIN 53752 10-6K-1 80	
Service temperature, long term Average °C -40	135
Service temperature, short term (max.) Average °C 200	
Heat deflection temperature DIN EN ISO 75, method A °C 160	
Electrical properties	
Dielectric constant IEC 60250 3,8	
Dielectric dissipation factor (50Hz) IEC 60250 0,13	
Volume resistivity IEC 60093 Ω *cm 10^{15}	
Surface resistivity IEC 60093 Ω 10 ¹⁶	
Comparative tracking index IEC 60112 400	
Dielectric strength IEC 60243 kV/mm 22	

The following applies to Polyamides: Under the influence of moisture absorption, the mechanical properties change. The material becomes tougher and more resistant to impact, the modulus of elasticity declines. Depending on the environmental atmosphere, the temperature and the period of moisture absorption, only the surface layer is affected by alterations of property to a certain depth. On thick-walled parts, the center area remains unaffected. The short-term maximum application temperature only applies to very low mechanical stress for a few hours. The long-term maximum application temperature is based on the thermal ageing of plastics by oxidation, resulting in a decrease of the mechanical properties. This applies to an exposure to temperaturers for at least 5.000 hours causing a 50% loss of the tensile strength from the original value (measured at room temperature). This value says nothing about the mechanical strength of the material at high application temperatures. In case of thick-walled parts, only the surface layer is affected by oxidation from high temperatures. With the addition of antioxidants, a better protection of the surface layer is achieved. In any case, the center area of the material remains unaffected. The minimum application temperature is basically influenced by possible stress factors like impact and/or shock under application. The values stated refer to an minimum degree of impact stress. The electrical properties as stated result from measurements on natural, dry material. With other colours (in particular black) or saturated material, there may be clear differences in the electrical properties. The data stated above are average values ascertained by statistical tests on a regular basis. They are in accordance with DIN EN 15860. They serve as information about our products and are presented as a guide to choose from our range of materials. This, however, does not include an assurance of specific properties or the suitability for particular application purposes that are legally binding.
